

# Feral Animal Control

Feral animals are recognised as a threat to native fauna and flora. Traps are set to capture feral animals; these traps are often located in remote areas.

Know where your traps are and be able to determine the most productive locations.

Monitor the trap to know when the trigger has been activated.

Understand the climatic conditions at the location of the trap to ensure animals are treated humanely.

The ORB-X1 can be powered by AA batteries or a solar panel.

A built-in GPS can determine trap location.

Use the internal temperature sensor to estimate conditions for trapped animals. Use an external temperature and humidity sensor with the ORB-X1 MODBUS for accurate condition monitoring.

Receive online, SMS and email warnings and alarms.
